DESCRIZIONE COMPLETA

The main peculiarities of this boat are the seaworthiness and the very light displacement that allows you to navigate with very low consumption. It is a pilot project both in terms of its creation and also of its propulsion. The concept behind the development of this boat was to bring the technological characteristics and design techniques from sail-powered and racing vessels to the world of motor-driven crafts. This includes the construction of the hull, the bulkheads and the structural systems, using grp composites with carbon reinforcements and vacuum lamination processes using epoxy resins.
